Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil pal groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and

                                                                                                                                                                                                                                                                              specific clones were used to screen for recombinant plasmids. Only two clones 5G3 and 15C5 were found to contain the whole prorennin sequence, with clone 5G5 having its complete coding sequence (shown here). The sequence was the same as the published sequence except for two silent mutations in codons 274 and 336 respectively, and a single mutation in codon 302 which converts the sequence to the B form of rennin. The product of prorennin, rennin is an active component of rennet which is used to clot milk in the process of making cheese.

The heterologous peptide or protein may also be human insulin-like growth factor I. The constructs provide high yields of the protein with simple recovery from the milk. Activation of the gene occurs only in the mammary gland. See also AAQ14050, AAQ14774-77.

The gene was placed in operable linkage with the al-3 promoter (see AAT03005). The al-3 gene controls the production of geranyl geranyl pyrophosphatase (GGPP) synthetase. GGPP is a precursor for carotenoids and xanthophylls. It has been shown that exposure to light increases the transcription level of GGPP synthetase 15-45 fold. Light activates a number of genes in the common bread mould, Neurospora. This can be used to regulate the expression of genes encoding heterlogous proteins, e.g. chymosin, in recombinant production systems. Use of a light-regulated promoter is a simple and effective way to control expression and allows timing to be adapted to the physiological

         The inventors claim isolated chymosin (rennin) and prochymosin generation calves, and plasmids conty. the genes which are capable of replicating in a prokaryotic organism. The prokaryotic organism is pref. an Escherichia species, esp. E. coli p Gx 1225 (NRRL B-13061) The microorganisms transformed by the plasmid are also claimed.
                                                                                                                Isolated chymosin or rennin and prochymosin genes - which replicate in prokaryotic organisms, esp. Esche and organisms used for chymosin biosynthesis

                                                                                                                                                     The DNA encoding prochymosin can be cloned into a plasmid (esp. fros. cremoris SK112) and used to produce large amts of the protein by recombinant DNA techniques. This could overcome the shortage of prochymosin due to shortage of calf stomachs and increasing cheese prodn. Prochymosin is also used in prodn. of yoghurt, butter and buttermilk. The gene may be ligated into plasmid poGE21 and expressed in E. coli. The resulting expressed enzyume is a well known milk-clotting enzyme used in cheese-making.

GAL1 promoter linked to gene - useful for direction of expression of the gene in yeast cell. The recombinant material carrying a GAL1 promoter of the yeast galactokinase gene may be used in expressing a desired protein, esp. bovine growth hormone, interferon, prorennin or preprorennin, in the yeast cell. Strains of Saccharomyces cerevisiae producing the polypeptides are produced. Yeast strains deposited as ATCC 20643, 20662, and 20663, strain designations CGY 196, 457, 461 and
                                                     Kluyveromyces host cells for producing polypeptide(s) - used for highly efficient prodn of eg chymosin tissue

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     //notes Torgan: pooled; Vector: pT7T3D-Pac (Pharmacia) with /notes Torgan: pooled; Not I; Site_2: Eco RI; a modified polylinker; Site_1: Not I; Site_2: Eco RI; equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR amplified cDNAs from pools of ,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479."

X52626

X52626.1 G1:20972

alpha-phaseolin; glycoprotein; phaseolin; seed storage protein.

phaseolus vulgaris.

Phaseolus vulgaris

Enkaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;

Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots;

Rosidae; eurosids I; Fabales; Fabaceae; Papilionoideae; Phaseoleae.

phaseolus vulgaris.
phaseolus vulgaris
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The variability in transcription initation may be due to multiple and overlapping TATA-elements in the genomic sequence (see <PVPHASL>). Seven slightly different alpha-phaseolin cDNA clones were detected. Whether the differences represent nucleotide substitutions in allelic genes or show divergences of non-allelic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Rosidae; eurosids I; Fabales; Fabaceae; Papillonoideae; Phaseoleae;

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil pal groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and

                                                                                                                                                                 The present sequence represents the bean phaseolin promoter, which CC is used to construct plasmids for the expression of the P. putida CC faoAB gene. The gene encodes an enzyme that may be used in the CC method of the invention. The specification describes a method for CC manipulating the metabolism of a plant, and comprises expressing a CC heterologous gene encoding fatty acid oxidation enzymes in the CC cytosol or plastids other than the peroxisomes glyoxisomes or CC mitochondria of the plant. The method may be used to enhance the CC biological production of polyhydroxyalkanoates or novel oil compositions CC in a transgenic plant. Plants which may be used to produce these CC compounds in this way include Brassicas, maize, soybean, cottonseed, CC sunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco and CC sunfla. The method may also be used to prevent or suppress seed CC production and therefore increase the production of biomass (leaves, xxx etc.)
